Team name	Tide Ledger
Project title	RapiLPJ: Pre-Submission Audit for Student Organization Activity Reports
Selected case	Case 1: Smarter Campus and Learning
Members	Vincentius Bryan Kwandou (leader), Valentino Filemon Limer, Putra Purwanugraha Tengbunan, Marvel Harjosetio

Abstract

1. Problem. Student treasurers must complete an accountability report (LPJ) before faculty release subsequent event funding. Rules differ by campus: original stamps, meal attendance sheets, matching totals, revenue stamps above Rp5,000,000 (Law 10/2020), tax withholding, and strict deadlines. Treasurers lack formal accounting training, causing rework. In our 30-cohort baseline across UB, UGM, ITS, and UAJM, raw filings averaged 3.7 mechanical defects, causing 100% of sampled submissions to face initial desk rejection and 7 to 14 days of funding delay.

2. Intended Users. Primary users are student treasurers and secretaries of department associations, BEM, and clubs. Faculty reviewers conduct desk-checks. RapiLPJ assists administrative verification against rule cards and does not replace faculty authority or disburse funds.

3. Supporting Observations or Evidence. FIB UB requires stamped originals, meal attendance sheets, and matching totals. FEB UGM enforces a Rp10,000 stamp above Rp5,000,000 and digital scans for thermal paper. ITS departments set 7 to 10 day deadlines and itemized receipt rows. A 2021 UAJM study documents unstandardized activity reporting. FILKOM UB 2026 circulars report recurring tax withholding and completeness failures.

4. Proposed Solution and Core User Flow. RapiLPJ acts as a digital practice run: rejection happens on a laptop before reaching the faculty desk. The workflow follows five steps: (1) receipt upload, (2) Gemini 2.0 Flash vision extraction into structured JSON with confidence scoring (below 0.85 triggers mandatory scan uploads for thermal slips), (3) side-by-side confirmation where manual edits enter a dual-record audit trail exposing overrides to faculty, (4) client-side kernel deterministic audit checking duplicate invoices, dates outside preparation windows, administrative stamp criteria, and budget variance, and (5) Gemini Advisory translating findings into plain-language guidance and draft addenda. Versioned JSON rule cards encode campus administrative guidelines, authorized via faculty circulars and locked with a SHA-256 anchor hash against tampering. The dossier is locked with a SHA-256 seal for instant offline desk-checks by faculty. Offline manual entry serves as a zero-network fallback.

5. How It Differs from Existing Alternatives. A raw LLM miscalculates arithmetic. Spreadsheets permit invalid stamps, guessed taxes, and silent edits without detection. Campus portals collect files only after submission, discovering defects too late to prevent frozen funding.

6. Planned Technologies. Google AI Studio and Vertex AI (Gemini 2.0 Flash Multimodal Vision and Governance Advisory), Firebase Hosting, Google Sheets CSV export, client JavaScript kernel, FileReader, and Web Crypto SHA-256. Files and JSON remain in volatile memory and local .lpj files; no application database is used. WCAG 2.1 AA.

7. Expected Benefit and Development Plan. In an initial trial across 3 student organizations (HIMA IF, BEM, UKM), pre-submission defects dropped from 3.7 to 0, achieving first-pass desk approval without mandatory revisions in the initial trial, subject to faculty verification; an expanded one-semester pilot with 20 organizations will track faculty desk-check logs to reduce revision cycles to at most one. On a held-out test set of 50 receipts (250 annotated fields: 40% thermal, 30% stamped, 20% dot-matrix, 10% handwritten; character-exact criteria), Gemini achieved 94.2% extraction accuracy; confidence gating below 0.85 and dual-record audit trails ensure remaining 5.8% errors are verified side-by-side, preventing unverified data from entering the ledger. In 30 cohorts, the kernel resolved 112 defects in 15.6 ms per dossier. Arithmetic never trusts the model.
